

BASIC USER MANUAL

Seller Dashboard / CMS

Complete basic user guide for local seller operations

Document: Seller_Dashboard_Basic_User_Manual.pdf

Prepared on: July 6, 2026

Project path:

src\pages\seller_dashboard\basic_user_manual\

Audience: Seller users, store operators, QA testers, and support teams

Screenshot source: Running frontend with documentation mock API data.
UI, routes, forms, and controls are from the real codebase.

Table Of Contents

1. Service Overview	11. Orders Module
2. Local Access And Run Instructions	12. Offers And Campaigns Module
3. Backend And API Dependencies	13. Revenue Analytics Module
4. Feature Availability Summary	14. Team Management Module
5. New User Step-By-Step Guide	15. Audit Activity Module
6. Existing/Test User Guide	16. Buttons, Menus, Icons, And User Actions
7. Global Navigation And Layout	17. Validation Messages
8. Login Page	18. Common Errors And Troubleshooting
9. Dashboard Overview	19. Limitations And Future Improvements
10. Products Module	20. Final Verification Notes

This manual covers only the functionality present in the Seller Dashboard / CMS frontend, routes, and visible API integration. Buyer features such as wishlist, cart, checkout, and payment collection are marked as not implemented because they are not part of this module.

1. Service Overview

The Seller Dashboard / CMS is a seller-facing control panel for managing catalog, seller orders, offers, revenue analytics, team access, and audit activity. It is a React, TypeScript, Vite frontend located at `frontend/seller-dashboard`.

The application is protected by seller session validation. A user must log in with a seller-capable role, and the active seller must have status `active`.

Main Routes

Route	Page	Purpose
<code>/login</code>	Seller login	Email/phone and password login for seller accounts.
<code>/seller</code>	Overview	Protected shell and active seller context.
<code>/seller/products</code>	Products	Product list, status/category filters, and create/edit entry points.
<code>/seller/products/new</code>	Create product	Product draft creation form.
<code>/seller/products/:productId/edit</code>	Edit product	Product edit form and publish button when applicable.
<code>/seller/orders</code>	Orders	Seller order list, search, date, status, and pagination filters.
<code>/seller/orders/:orderId</code>	Order detail	Order detail from list route state and fulfillment update form.
<code>/seller/offers</code>	Offers	Coupons table and campaign calendar.
<code>/seller/offers/coupons/new</code>	Create coupon	Coupon form.
<code>/seller/offers/coupons/:couponId/edit</code>	Edit coupon	Coupon edit form.
<code>/seller/offers/campaigns/new</code>	Create campaign	Campaign form.
<code>/seller/analytics</code>	Revenue analytics	Revenue, GMV, orders, conversion, trend charts, and top products.
<code>/seller/team</code>	Team	Staff list, permissions matrix, invite, role, resend, and disable UI.
<code>/seller/audit</code>	Audit	Audit filters and activity timeline.

2. Local Access And Run Instructions

Docker local run

- 1 Start the full local stack with `docker compose up -d --build`.
- 2 Open the Seller Dashboard at `http://localhost:3001`.
- 3 Check frontend health at `http://localhost:3001/healthz`.
- 4 Check gateway readiness at `http://localhost:8080/health/ready`.

Manual frontend run

- 1 Open a terminal at `frontend/seller-dashboard`.
- 2 Use `.env.example` values or set `VITE_API_BASE_URL=http://localhost:8080`.
- 3 Start Vite with `..\..\node_modules\.bin\vite.CMD --host 127.0.0.1 --port 5174` or use the workspace script `corepack pnpm dev:seller` when pnpm is available.
- 4 Open `http://127.0.0.1:5174`.

Manual Vite uses port `5174`. Docker serves the same app on `3001`. If API calls fail in manual mode, confirm that the API Gateway CORS policy allows the Vite origin.

3. Backend And API Dependencies

The frontend calls APIs through `VITE_API_BASE_URL` , which defaults to `http://localhost:8080` . In Docker local mode this is the API Gateway.

Dependency	Endpoint / Port	Service	Dashboard Use
Seller session	<code>GET /api/v1/seller/session</code>	API Gateway	Required for protected dashboard access and seller context.
Seller login	<code>POST /api/v1/auth/login</code>	Auth service through API Gateway	Required for the login form.
Categories	<code>GET /api/v1/categories</code>	Product service	Required for product category selection and category labels.
Products	<code>GET/POST/PATCH /api/v1/seller/products</code>	Product service	Required for catalog listing, creation, edit, and publish.
Orders	<code>GET /api/v1/seller/orders</code>	Order service	Required for seller fulfillment list.
Fulfillment	<code>PATCH /api/v1/seller/orders/{order_id}/fulfillment</code>	Order service	Required for shipment update.
Coupons	<code>GET/POST/PATCH /api/v1/seller/coupons</code>	CMS service	Required for coupon list, create, and edit.
Campaigns	<code>GET/POST /api/v1/seller/campaigns</code>	CMS service	Required for campaign calendar and create flow.
Analytics	<code>GET /api/v1/seller/dashboard/summary</code>	CMS service	Required for revenue dashboard.
Team	<code>/api/v1/seller/team...</code>	Not found in backend routes	Frontend expects it, but route implementation was not found.
Audit	<code>GET /api/v1/seller/audit-logs</code>	CMS handler present; gateway contract absent	May require gateway route wiring before live use.

Service Health Checks

Service	Local check
API Gateway	<code>http://localhost:8080/health/ready</code>
Auth Service	<code>http://localhost:8081/readyz</code>
Product Service	<code>http://localhost:8082/readyz</code>
CMS Service	<code>http://localhost:8087/healthz</code>
Order Service	<code>http://localhost:8090/readyz</code>
Payment Service	<code>http://localhost:8091/healthz</code>
MySQL / MongoDB / Redis	Required by backend services and migrations.

Seed Data

Real local seller seed credentials were found in `LOCAL_ACCESS_GUIDE.md` and migration files under auth, user, and CMS services.

Area	Email	Password	Role / Context
Seller Dashboard / CMS	<code>seller.local@example.com</code>	<code>LocalDemo#2026!</code>	<code>seller</code> , seller ID <code>seller_local_demo</code>

These credentials are local/demo only. They must not be used as production credentials.

4. Feature Availability Summary

Functionality	Status	Notes
Login	Available	Seller login form posts to <code>/api/v1/auth/login</code> and stores a seller session token in session storage.
Registration	Not Implemented	No seller registration or onboarding screen exists inside this dashboard module.
Dashboard overview	Partial	Protected shell, seller context, and reserved overview area exist. Dedicated overview metrics are shown as unavailable in the code.
Products	Available	List, filter by status/category, page size, create draft, edit product, image URLs, attributes, variants, validation, and publish action.
Product search	Partial	No text search field exists on products. Status, category, and page-size filters are available.
Orders	Available / Partial	List, filters, cached detail page, shipment update form, customer/shipping, refunds and history display. Direct detail fetch is not implemented in the frontend contract.
Offers and coupons	Available / Partial	Coupons list/create/edit and campaigns list/create are present. Advanced coupon rules are outside the current request schema.
Analytics	Available / Partial	Revenue, GMV, orders, conversion, trends, and top products render when the CMS summary API returns data. No export action exists.
Team management	Partial	Frontend UI exists for invite, role update, resend invite, and disable staff. Gateway/backend seller-team routes were not found in the analyzed code.
Audit activity	Partial	Frontend and CMS HTTP handler exist. Seller audit endpoint is not present in the gateway master API contract, so gateway availability could not be verified.
Wishlist	Not Implemented	Not part of the Seller Dashboard / CMS UI.
Cart	Not Implemented	Not part of the Seller Dashboard / CMS UI.
Checkout/order placement	Not Implemented	Seller dashboard manages seller orders but does not place buyer orders.
Payment flow	Not Implemented	No payment collection screen exists. Refund data can be displayed on order detail if provided by the order/payment backend.
Profile/account management	Partial	Seller switcher exists. Account icon is visible but no account menu action is implemented.
Notifications	Not Implemented	No notification center, bell, or notification settings screen exists in this frontend.
Logout	Not Implemented	A session clearing helper exists in code, but no logout button or menu item is wired in the UI.

5. New User Step-By-Step Guide

Open Application

- 1 Start the local stack or the manual Vite frontend.
- 2 Open `http://localhost:3001` for Docker or `http://127.0.0.1:5174` for manual Vite.
- 3 The root route redirects to `/seller`. If no seller session is valid, the app redirects to `/login`.

Register New Account

Screenshot to be added: Seller Registration Page. Status: Not Implemented in this frontend module.

No registration screen, seller onboarding form, KYC form, or seller approval workflow exists in the Seller Dashboard / CMS frontend. New seller account creation must be handled outside this module.

Login

- 1 Open `/login`.
- 2 Enter seller email or phone.
- 3 Enter password with at least 8 characters.
- 4 Select **Continue**.
- 5 If the account has a seller role and active seller context, the dashboard opens.

Login Page

The login screen is available in the Seller Dashboard module.

- 1. Email or phone field.
- 2. Password field.
- 3. Continue button with login icon.

Browse Home Page / Dashboard

- 1 After login, use the left sidebar to open available modules.
- 2 Use the seller switcher in the topbar if multiple active sellers are returned by the session API.
- 3 Read the Overview notice for the active seller and available dashboard sections.

Dashboard Overview

The overview confirms the active seller and shows that dedicated overview metrics are unavailable in the current frontend contract.

1. Sidebar navigation.

2. Seller switcher and account icon.
3. Active seller summary.

4. Overview metrics unavailable notice.

6. Product, Search, And Filter Guide

Product Listing

- 1 Open **Products** from the sidebar.
- 2 Use status buttons to filter by all, draft, submitted, approved, rejected, published, or unpublished.
- 3 Use the category dropdown to show products from one category.
- 4 Use page size to show 10, 20, or 50 rows.
- 5 Select **Add product** to create a draft.
- 6 Select **Edit** to open an existing product.

Product text search is not present. Category and status filters are the available catalog search/filter controls.

Page 1 - 3 total

5

Products can be filtered by status and category. The table shows product, category, price, stock, status, and edit action.

1. Status filter buttons.

2. Category and page-size filters.
3. Add product button.

4. Edit action.
5. Pagination arrows.

Create Or Edit Product

- 1 Open **Add product** or **Edit**.
- 2 Enter title, brand, category, and description.
- 3 Add product attributes using key and value rows.
- 4 Add one or more image URLs. File upload appears only if an upload handler is passed; the current form uses URL entry.
- 5 Add variants with SKU, price, stock, and optional variant attributes.
- 6 Use the publish checklist to confirm title, category, variant, and image readiness.
- 7 Select **Save draft** or **Save changes**.
- 8 On edit, select **Publish** when the product status allows publishing.

The product form supports product basics, category, description, checklist, attributes, images, and variants.

1. Title and brand fields.

2. Category selector.

3. Publish checklist.

4. Image URL input and Add URL button.

5. Variant editor.

7. Orders Guide

Order Listing And Search

- 1 Open **Orders** from the sidebar.
- 2 Search by order ID.
- 3 Filter by From and To dates.
- 4 Choose page size.
- 5 Use status buttons such as Paid, Packed, Shipped, Delivered, Cancelled, or Refunded.
- 6 Select **View** to open the order detail.

Page 1 - 2 total

The order list is designed for seller fulfillment review and filtering.

- 1. Order ID search.
- 2. Date filters.
- 3. Page size and reset.
- 4. Status filters.
- 5. View order action.

Order Detail And Fulfillment

- 1 Open the detail page from the order list. Direct URL loading is partial because the frontend does not fetch order detail independently.
- 2 Review totals, items, customer, shipping, shipment, status history, and refunds.
- 3 If the order is paid, packed, or shipped, and the seller role has permission, use **Update fulfillment**.
- 4 Select next status. Allowed transitions are paid -> packed/shipped, packed -> shipped, and shipped -> delivered.
- 5 Optionally enter carrier and tracking number.
- 6 Select **Update shipment**.

Create campaign

The campaign create form supports name, start time, end time, and optional INR budget.

1. Campaign name.

2. Start and end date/time fields.

3. Optional budget amount.

4. Create campaign button.

9. Revenue Analytics Guide

- 1 Open **Analytics** from the sidebar.
- 2 Choose preset date range: 7D, 30D, or 90D.
- 3 Use From and To date inputs for custom range.
- 4 Review revenue, GMV, orders, and conversion cards.
- 5 Review trend charts and top products. If the API omits a metric, the UI shows Not available or an unavailable state.

Revenue Analytics

Analytics is read-only and depends on the CMS summary API.

- 1. Preset date range controls.
- 2. Custom date range inputs.
- 3. Metric cards.
- 4. Revenue and GMV trend chart.
- 5. Conversion meter.

No analytics export, saved report, or drill-down action exists in this frontend module.

10. Team Management Guide

Status: Partial. The frontend UI exists, but seller-team backend/gateway routes were not found during code analysis.

- 1 Open **Team** from the sidebar.
- 2 Review invited, active, and disabled counts.
- 3 Review the role access matrix.
- 4 Filter staff by status and rows.
- 5 Use role dropdowns to update assignable roles when permitted.
- 6 Use **Resend** for invited users and **Disable** for non-owner staff when permitted.
- 7 Select **Invite staff** to open the invite dialog.

Team page displays role matrix, staff filters, role dropdowns, and row actions.

1. Invite staff button.

2. Role access matrix.

3. Status and rows filters.

4. Role dropdown.

5. Resend and Disable actions.

Invite Staff Dialog

Invite dialog collects email address and assignable role.

1. Email address field.
2. Role selector.
3. Cancel button.
4. Send invite button.
5. Close button.

Roles

Role	Description
Owner	Full access across seller operations and team controls. The owner role is protected and cannot be assigned from this dashboard.
Manager	Broad day-to-day access, including team and audit visibility.
Catalog Editor	Catalog and offer access without orders or team controls.
Order Manager	Order fulfillment and analytics access without catalog writes.

11. Audit Activity Guide

Status: Partial. The frontend and CMS HTTP handler exist, but the seller audit endpoint was not found in the gateway master API contract.

- 1 Open **Audit** from the sidebar.
- 2 Use **Refresh** to reload the timeline.
- 3 Filter by actor, action, resource type, resource ID, From date, To date, and rows.
- 4 Select **Apply** to apply filters.
- 5 Select **Reset** to clear filters.
- 6 Select linked resources to navigate to related product, order, coupon, campaign, or team page.
- 7 Select **Load more** when another audit page is available.

Audit timeline shows actor, resource, action, relative time, and changed-field summaries.

1. Refresh button.

2. Filter fields.

3. Rows, Reset, and Apply controls.

4. Audit event card.

5. Changed fields summary.

12. Buttons, Menus, Icons, And User Actions

Control	Location	User Action
Menu icon	Topbar and mobile	Opens mobile sidebar or collapses/expands desktop sidebar.
Seller switcher	Topbar	Changes active seller when more than one active seller is returned by the session API.
Account icon	Topbar	Visible only. No implemented account menu action was found.
Sidebar items	Left navigation	Open Overview, Products, Orders, Offers, Analytics, Team, or Audit routes.
Add product	Products	Opens the product create form.
Edit	Products and coupons	Opens the selected product or coupon editor.
Previous/Next arrows	Tables and calendar	Change table page or campaign calendar month.
Publish	Product editor	Submits a publish request for draft, approved, or unpublished products.
Add URL / Remove image	Product editor	Adds an image URL to the product or removes an existing image.
Add variant / Remove variant	Product editor	Adds or removes product variant rows. The last variant cannot be removed.
View	Orders	Opens the order detail page using order data passed from the list.
Update shipment	Order detail	Sends fulfillment status, carrier, and tracking number.
New coupon / New campaign	Offers	Open create forms for coupon or campaign.
Coupons / Campaigns tabs	Offers	Switch between coupon table and campaign calendar.
7D / 30D / 90D	Analytics	Apply preset analytics date ranges.
Invite staff	Team	Opens the staff invite dialog when the role has permission.
Resend	Team	Resends an invite for invited staff, subject to permission.
Disable	Team	Disables a non-owner staff member, subject to permission.
Refresh	Audit	Refetches the audit timeline.
Apply / Reset	Audit filters	Applies or clears audit filters.
Load more	Audit timeline	Loads the next page of audit logs when available.

Global Layout Notes

- The sidebar contains Overview, Products, Orders, Offers, Analytics, Team, and Audit links.
- The menu icon collapses the sidebar on desktop and opens it on mobile.
- The seller dropdown shows active seller context. Non-active seller options are disabled.
- The account icon has label `Open account menu`, but no menu behavior was found.
- Permission gates hide or disable controls according to seller role permissions.

13. Forms And Validation Messages

Module	Condition	Message
Login	Blank email/phone or short password	Enter your seller email and password.
Products	Title under 3 characters	Enter a product title with at least 3 characters.
Products	No category selected	Select a category.
Products	Invalid image URL	Enter a valid image URL.
Products	No variant	Add at least one variant.
Products	SKU under 2 characters	Enter a SKU with at least 2 characters.
Products	Price less than or equal to 0	Enter a price greater than 0.
Products	Stock is decimal or negative	Stock must be a whole number. / Stock cannot be negative.
Orders	Carrier over 80 characters	Carrier must be 80 characters or fewer.
Orders	Tracking number over 80 characters	Tracking number must be 80 characters or fewer.
Coupons	Code under 3 characters	Enter a coupon code with at least 3 characters.
Coupons	Code over 64 characters	Coupon code cannot exceed 64 characters.
Coupons	Invalid code characters	Use only A-Z, 0-9, underscore, or dash.
Coupons	Percentage over 100	Percentage discount cannot exceed 100.
Coupons	End date before start date	End time must be after start time.
Campaigns	Name under 3 characters	Enter a campaign name with at least 3 characters.
Campaigns	Missing campaign date	Select a campaign start time. / Select a campaign end time.
Campaigns	End date before start date	Campaign end time must be after start time.
Team	Invalid staff email	Enter a valid email address.
Audit	From date after To date	From date must be before To date.

Common State Messages

State	Meaning
Loading	The frontend is waiting for API data, such as seller session or table rows.
Refreshing	Data is being refetched while previous rows remain visible.
Empty	The API returned no matching data for the selected filters.
Unavailable	The feature or data source is not available in the current contract.
Permission denied	The active seller role does not have the required permission.
Failed	The API returned an error; request ID is shown when available.

14. Existing/Test User Guide

Use Local Demo Seller

- 1 Start the local stack with migrations.
- 2 Open `http://localhost:3001/login`.
- 3 Enter `seller.local@example.com`.
- 4 Enter `LocalDemo#2026!`.
- 5 Select **Continue**.
- 6 Confirm the topbar seller switcher shows **Local Demo Store** with **Active** status.

If Creating A New Local User Manually

No seller registration UI exists in this module. If a developer adds a local seller manually, the account must have:

- An active auth account with a seller role.
- A linked active user record.
- An active seller profile.
- A CMS seller staff record with an allowed seller role.
- Matching seller ID in token/session context.

Example registration data format, not a login credential: seller email, password, store display name, seller profile status, role, and staff status.

15. Common Errors And Troubleshooting

Problem	Likely Cause	Fix
Login redirects back to login	No valid token/session or login response missing seller role.	Use seeded seller credentials. Check <code>auth-service</code> , API Gateway, and role assignments.
401 or 403 on dashboard	Seller context missing, inactive seller, or role lacks permission.	Confirm seller profile status is <code>active</code> and role is <code>seller</code> , <code>seller_manager</code> , <code>seller_catalog_editor</code> , or <code>seller_order_manager</code> as needed.
Seller approval pending page	Session returned seller status <code>pending</code> .	Complete seller approval/KYC outside this dashboard.
Seller account suspended page	Session returned seller status <code>suspended</code> .	Contact support or update seller status in backend admin flow.
Categories could not be loaded	Product service or categories endpoint unavailable.	Check <code>http://localhost:8082/readyz</code> and product/category seed data.
No active categories are available	Category API returned empty list.	Seed active product categories before product creation.
Request timed out	API did not respond before <code>VITE_API_TIMEOUT_MS</code> .	Check gateway and downstream service logs.
Order detail unavailable on direct URL	Frontend detail page does not fetch order detail by ID.	Open the order from the Orders table so route state/cache is available.
Team actions fail	Seller team backend/gateway routes not found in the analyzed code.	Implement/wire <code>/api/v1/seller/team</code> routes or hide the UI until available.
Audit route fails through gateway	Seller audit endpoint absent from gateway master API contract.	Add gateway route for <code>/api/v1/seller/audit-logs</code> or use the CMS internal route with proper gateway bridge.
Manual Vite API calls fail with CORS	Gateway CORS does not allow <code>http://127.0.0.1:5174</code> .	Add the manual Vite origin to CORS policy or run Docker frontend on <code>localhost:3001</code> .
Seeded login fails on old database	Seed migrations were added after local database was created.	Run <code>docker compose up --force-recreate migrate-auth migrate-user migrate-cms migrate-mongodb</code> .

16. Limitations And Future Improvements

Current Limitations

- No seller registration, onboarding, KYC, password reset, logout, profile editing, notification center, wishlist, cart, checkout, or payment collection UI in this module.
- Overview metrics are explicitly unavailable in the overview page.
- Order detail works from list navigation only; direct detail fetch is not part of the frontend contract.
- Team management UI is present, but expected backend/gateway routes were not found.
- Seller audit UI is present, and CMS has a handler, but gateway contract availability was not verified.
- Coupon request schema does not include product/category scope, max discount cap, new-user-only rules, or per-user limits.
- No product delete, coupon disable, campaign edit, campaign disable, analytics export, or audit export UI was found.

Recommended Future Improvements

- Add seller registration/onboarding or link clearly to the external seller onboarding flow.
- Wire account menu with profile, session status, and logout.
- Add direct order detail fetch endpoint and frontend query.
- Complete gateway routes for seller team and seller audit logs.
- Add richer coupon rules if supported by backend contracts.
- Add CSV export where operational teams need reporting, especially audit and analytics.
- Add user-facing notifications for invite delivery, fulfillment updates, and API errors.

Final Verification Notes

This manual was created by reading the Seller Dashboard / CMS source code, routes, API modules, validation schemas, local runbooks, gateway/API contract, and backend service routes. Screenshots were captured from the running frontend with a documentation mock API to make the UI visible without requiring the full backend stack.

Could not verify live backend execution for team management and seller audit through the API Gateway contract. These are documented as partial.
